## **Evolution of topology in axi-symmetric and 3-d viscous flows**

G. Scheuermann, W. Kollmann, X. Tricoche, T. Wischgoll

### **Abstract**

Topological methods are used to establish global and to extract local structure properties of vector fields in axi-symmetric and 3-d flows as function of time. The notion of topological skeleton is applied to the interpretation of vector fields generated numerically by the Navier-Stokes equations. The flows considered are swirling jets with super-critical swirl numbers that show low Reynolds number turbulence in the break-up region.
